

Save in the Comfort Zone

When it comes to heating and cooling a commercial building, you probably know how hard it is to please everyone. Individual offices may be uncomfortably cool, while a conference room full of people is overheating. Ductless Heat Pumps (DHP) to the rescue. Not only do they control the temperature by zone, but they improve air quality and comfort in zones throughout the building. You'll save on energy costs, plus our incentives make DHPs even more appealing.

Lower costs, better air

Typical central air systems cycle on and off, which can create costly and uncomfortable temperature variations in offices, shops, restaurants and other commercial buildings. DHPs use variable speed compressors to continuously match your building's heating and cooling loads year-round. Plus, the systems trap harmful particulates from the air, so everyone can breathe easier. They're quiet and typically more efficient than central air, so DHPs save money by using less energy and having a long useful life.

Adjustable comfort

One of the most popular features of DHPs is that you can control your building's multiple heating/cooling zones independently, adjusting for factors such as number of occupants, type or duration of activity, and weather. You'll find many models and styles to meet your needs, plus installation is relatively easy and low-cost. A DHP may also add value to your property.

Pump up the benefits with incentives

It's a great time to talk with your contractor or contact us to find out more about how a DHP might improve the efficiency and value of your commercial space. Whether you want to retrofit or upgrade your system, incentives can help it all pencil out.

\$

Per ton cooling capacity for qualifying installations.
