

Grand Coulee Radio System Modernization

The purpose of this project is to modernize and enhance the Grand Coulee radio system to provide effective and reliable communication across the Grand Coulee Project and accommodate communications with outside entities. The existing radio system is past its operational life and maintenance and logistical support of these components is no longer feasible. The installation of a new system will address infrastructure needs and improve overall system reliability and availability. Additionally, increased signal coverage will improve communication capability among O&M, Security, and Emergency Response personnel; therefore, creating a much safer working environment.
