

Grand Coulee PGP Crane Modernization

The purpose of this project is to provide reliability for future power operations, routine maintenance activities, and support construction contracts. The project involves the replacement of two cranes and associated components of the power delivery and control systems. The current cranes have been in operation for over 60 years. The 70-ton gantry crane and the 60-ton overhead bridge crane will need a total replacement up to the power supply disconnect. It is imperative that all cranes be in excellent working order to help improve plant reliability routine maintenance activities, unscheduled or time critical repairs, and support construction contracts.
