

## **MCIT Replatforming**

The MCIT Replatforming project will establish eligible Transmission Technology (TT) applications in the new virtual TT infrastructure consistent with the MCIT Technology architecture. This is the final project in the MCIT Program. The first phase of the replatforming project will be to expand the Minimum Viable Product (MVP) infrastructure to provide the same capacity of the legacy environment today. The second phase of the project will be to roll out new infrastructure and platform services and deploy all applications from the legacy environment to the new MCIT replatforming platform. This will ensure all TT hardware, software, applications and services are NERC CIP compliant and have advanced security protection. The replatforming project is necessary to retire the outdated legacy system and is a precursor to the new Vancouver Control Center.
