

Ross Mobile Transfer Storage (MTS)

This project involves building a permanent, seismically resilient storage facility at the Ross Complex to house and protect mission-critical mobile transformers and associated support trailers. By moving this sensitive emergency response equipment from temporary outdoor exposure to a sheltered, co-located facility, the project extends the lifespan of the assets and ensures they are ready for rapid deployment during emergencies. The facility will also feature built-in oil spill containment to protect the environment and will streamline site logistics by consolidating necessary installation equipment and removing outdated modular structures that are beyond their service life.
